***** USER NOTES *****

Drilled by Roland (USGS Ruston LA) and Wesley Bolton (USDA ARS Oxford MS).

Core interval notes:

(note that this desc was viewed through plastic core sleeve and will be processed at the USDA ARS in Oxford MS):

- 10–15: mix of brown silt clay sand
- 15–20: brown and black coatings on sand grains
- 25–30: gray fine sand
- 40–45: fine to medium sand

Well construction: This 2" PVC monitoring well is ~50 ft from bottom of point to TOC with a 10 ft screen; screened interval is ~37-47 ft bls; MP is 3.00 above land surface with aluminum protective riser and 2 ft radius concrete slab; a 4" point was added to btm of casing; about 5 gallons of tap water were poured into PVC casing prior to pulling rods; this technique was used to balance and equalize pressure.

About 2 cups of bentonite granules were poured into the annular space of the borehole and bridged over around 20 ft below land surface (bls). Portland cement at a tap water ratio of 5-6 gals per 92-lb bag was used to seal the borehole from about 25 ft bls to land surface.

Water level:

7/31/19 @ 1045 = 18.25 - 1.00 - 3.00 = 14.25 ft bls measured with e-tape by Roland W Tollett of the USGS.

*Note that all water level tapes used by the USGS are calibrated by the HIF.
